Incineration of wastewater solids takes place in two steps. The first is drying the solids, so that their temperature is raised to the point that water in the solids evaporates. The second step is the actual combustion of the volatile fraction of the solids. Combustion can only take place after sufficient water is removed.

wastewater treatment plant operators remain independent of large power companies and their price increases for sludge incineration. The HUBER sludge2energy system includes our medium-temperature belt dryer. Hot dryer air is drawn by blowers through the slowly moving belts and the sludge layer thereon.

motion is to break up solid material to allow better surface contact with heat and oxygen. A sludge depth of about 1 inch is maintained in each hearth at the design sludge flow rate. Scum may also be fed to one or more hearths of the incinerator. Scum is the material that floats on wastewater.
